# Output of below program?

```
sum=10
def calculate():
    sum = 30
    sum = sum + 20
    currentSum = 200
    totalSum=sum+currentSum
    print(totalSum)

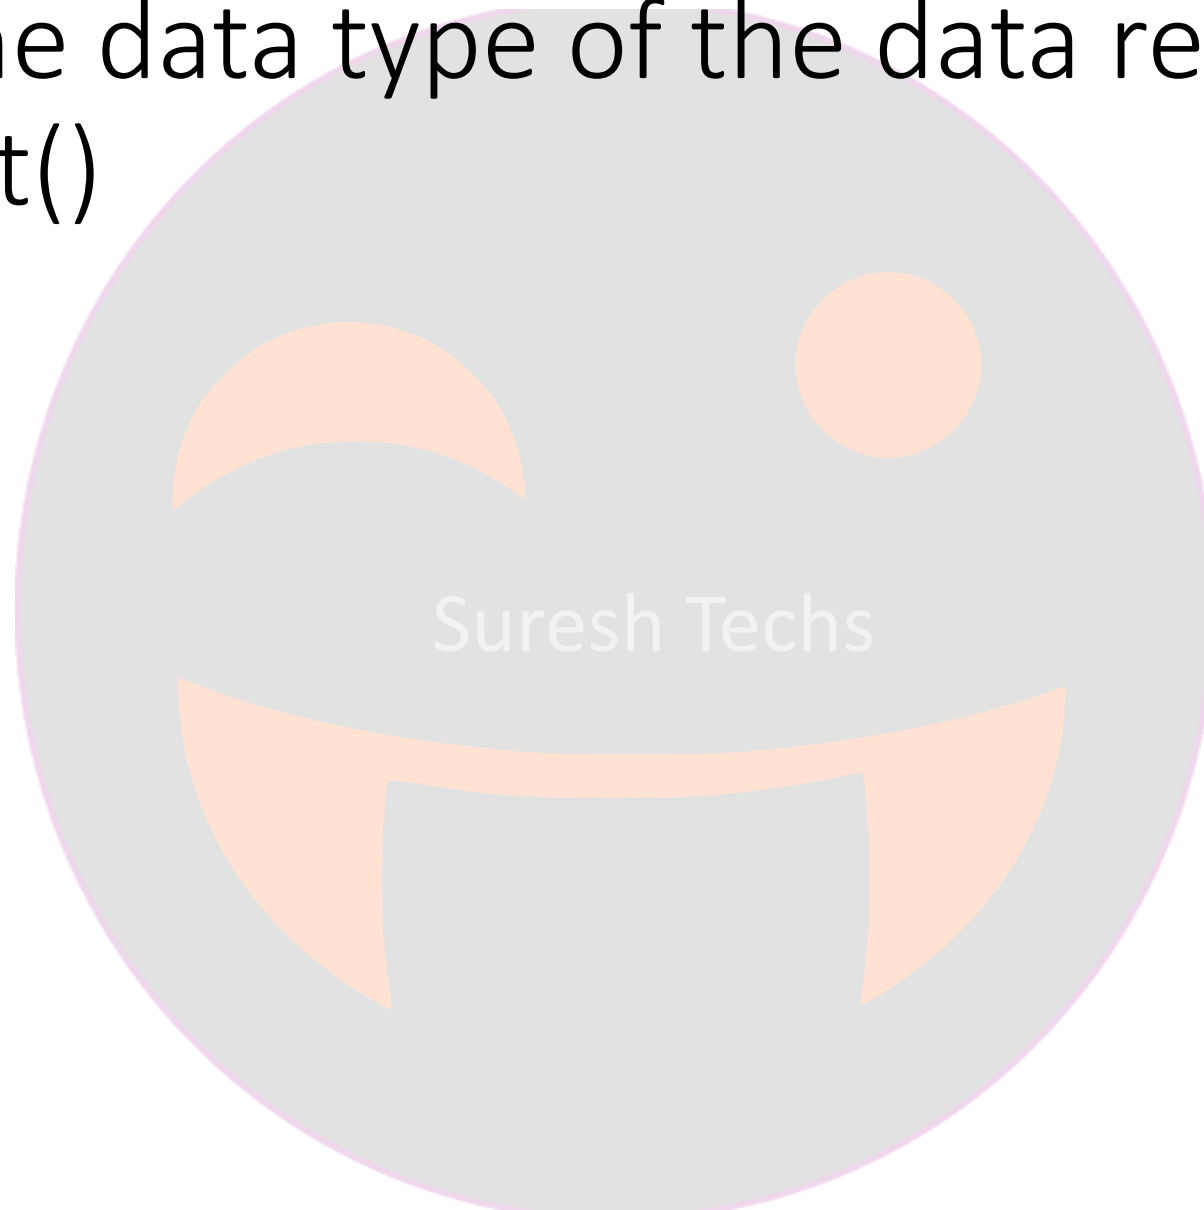

calculate();
print(sum)
```

250  
10

# What is the data type of the data received from input()

- str

# What is typecasting?

- Converting one data type to another data type is called type casting.
- `type()` is used to check the type of the data

Suresh Techs

# What is raw\_input()?

- It is same as input() function but it is part of python 2 version and was deprecated in python 3.

Suresh Techs

# How to take multiple inputs?

- Using split() method

```
name = input('Enter your name: ')
print('your name is: ',name)
doorNo, street, city, state = input('Enter your address - seperate by comma').split(",")
print('Address is: street {}, state {}'.format(street,state))
```

# How to print something without going to new line?

- end

```
print('welcome',end=" ")  
print('to suresh techs')
```

# What is the use // operator?

- It is part of arithmetic operator and is used to get floor value
